1. Обработка пропусков в данных, кодирование категориальных признаков, масштабирование данных.

Мы научимся обрабатывать пропуски в данных для количественных (числовых) и категориальных признаков и масштабировать данные. Также мы научимся преобразовывать категориальные признаки в числовые.

1.0.1. В чем состоит проблема?

- Если в данных есть пропуски, то большинство алгоритмов машинного обучения не будут с ними работать. Даже корреляционная матрица не будет строиться корректно.
- Большинство алгоритмов машинного обучения требуют явного перекодирования категориальных признаков в числовые. Даже если алгоритм не требует этого явно, такое перекодирование возможно стоит попробовать, чтобы повысить качество модели.
- Большинство алгоритмов показывает лучшее качество на масштабированных признаках, в особенности алгоритмы, использующие методы градиентного спуска.

1.1. Загрузка и первичный анализ данных

Используем датасет по супергеройским фильмам Most popular superhero TV shows.

[90]:
```
# Будем использовать только обучающую выборку
data = pd.read_csv('data/superheroes.csv', sep=",", thousands=',')
```

[91]:
```
# размер набора данных
data.shape
```

[91]:
```
(750, 8)
```

[92]:
```
# преобразование "object" в действительные типы колонок
data[["runtime", "imdb_votes"]] = data[["runtime", "imdb_votes"]].apply(pd.
 ↪to_numeric)

# типы колонок
data.dtypes
```

[92]:
```
show_title            object
imdb_rating           object
release_year          object
runtime              float64
```

```
genre                 object
parental_guideline    object
imdb_votes           float64
synopsis              object
dtype: object
```

[93]:
```
# проверим есть ли пропущенные значения
data.isnull().sum()
```

[93]:
```

2. Обработка пропусков в данных

2.1. Простые стратегии - удаление или заполнение нулями

Удаление колонок, содержащих пустые значения `res = data.dropna(axis=1, how='any')`

Удаление строк, содержащих пустые значения `res = data.dropna(axis=0, how='any')`

Документация

Удаление может производиться для группы строк или колонок.

[96]:
```
# Удаление колонок, содержащих пустые значения
data_new_1 = data.dropna(axis=1, how='any')
(data.shape, data_new_1.shape)

2.2. “Внедрение значений” - импьютация (imputation)

2.2.1. Обработка пропусков в числовых данных

[100]:
```
# Выберем числовые колонки с пропущенными значениями
# Цикл по колонкам датасета
num_cols = []
for col in data.columns:
    # Количество пустых значений
    temp_null_count = data[data[col].isnull()].shape[0]
    dt = str(data[col].dtype)
    if temp_null_count>0 and (dt=='float64' or dt=='int64'):
        num_cols.append(col)
        temp_perc = round((temp_null_count / total_count) * 100.0, 2)
        print('Колонка {}. Тип данных {}. Количество пустых значений {},␣

```

```
Колонка runtime. Тип данных float64. Количество пустых значений 106, 14.13%.
Колонка imdb_votes. Тип данных float64. Количество пустых значений 36, 4.8%.
```

[101]:
```
# Фильтр по колонкам с пропущенными значениями

4. Масштабирование данных

Термины “масштабирование” и “нормализация” часто используются как синонимы, но это неверно. Масштабирование предполагает изменение диапазона измерения величины, а нормализация - изменение распределения этой величины. В этом разделе рассматривается только масштабирование.

Если признаки лежат в различных диапазонах, то необходимо их нормализовать. Как правило, применяют два подхода: - MinMax масштабирование:

$$x = \frac{x - min(X)}{max(X) - min(X)}$$

В этом случае значения лежат в диапазоне от 0 до 1. - Масштабирование данных на основе Z-оценки:

$$x = \frac{x - AVG(X)}{\sigma(X)}$$

В этом случае большинство значений попадает в диапазон от -3 до 3.

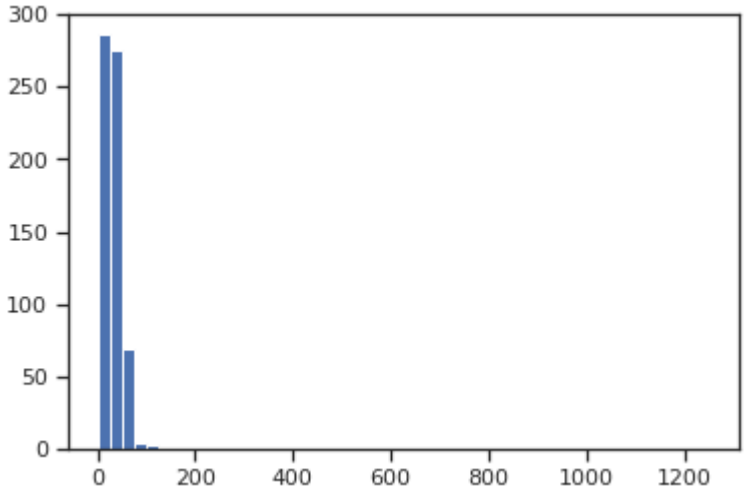
где X - матрица объект-признак, $AVG(X)$ - среднее значение, σ - среднеквадратичное отклонение.

[139]:
```
from sklearn.preprocessing import MinMaxScaler, StandardScaler, Normalizer
```

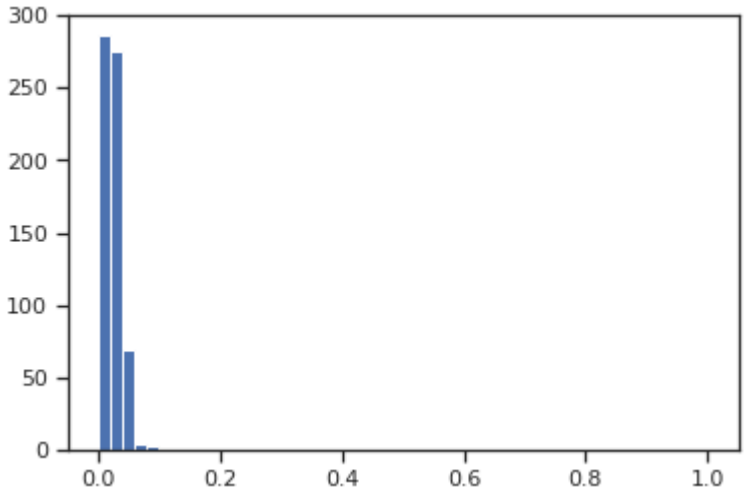
4.1. MinMax масштабирование

[140]:
```
sc1 = MinMaxScaler()
sc1_data = sc1.fit_transform(data[['runtime']])
```

[141]:
```
plt.hist(data['runtime'], 50)
plt.show()
```



[142]:
```
plt.hist(sc1_data, 50)
plt.show()
```



4.2. Масштабирование данных на основе Z-оценки - StandardScaler

[144]:
```
sc2 = StandardScaler()
sc2_data = sc2.fit_transform(data[['runtime']])
```

[145]:
```
plt.hist(sc2_data, 50)
plt.show()
```
